Hack Week

ECS Data Sciences Hack Week
May 14-19, 2018
Seattle, WA

Application Deadline: March 30, 2018

Building on the success of the first ECS Data Sciences Hack Day (October 2017), ECS is pleased to offer another opportunity at the ECS spring meeting in Seattle. In May 2018, the program will be expanded to an entire week as the next stage in ECS supporting a growing electrochemical data science and open source community. The goal of this event is to increase awareness and impact of data science tools, open source software, and shared datasets in electrochemistry and solid state science and technology, by bringing together people from different backgrounds to collaborate.

Hack Week will again be led by the very capable and engaging team from University of Washington: Dan Schwartz, David Beck, and Matt Murbach. The program will kick off on Monday, May 14 and have sessions all day Wednesday through Friday, as well as optional software training tutorials during the week. The activities will culminate with project presentations and an optional clamming expedition on Saturday, a traditional activity in the Puget Sound area.

Participant-driven workshops

diversity is excellence

participant-driven != unstructured

participant-driven != unstructured

- design with the most vulnerable participants in mind
- facilitate carefully
- mitigate Impostor Phenomenon

> “At a summer school, the young learn from the old.
> At a hack week, the old learn from the young.”
>
> — David W. Hogg

"At a summer school, the young learn from the old.
At a hack week, the everyone learns from everyone else."

— Daniela Huppenkothen

Tutorials

- practically oriented
- interactive
- make use of participants’ expertise

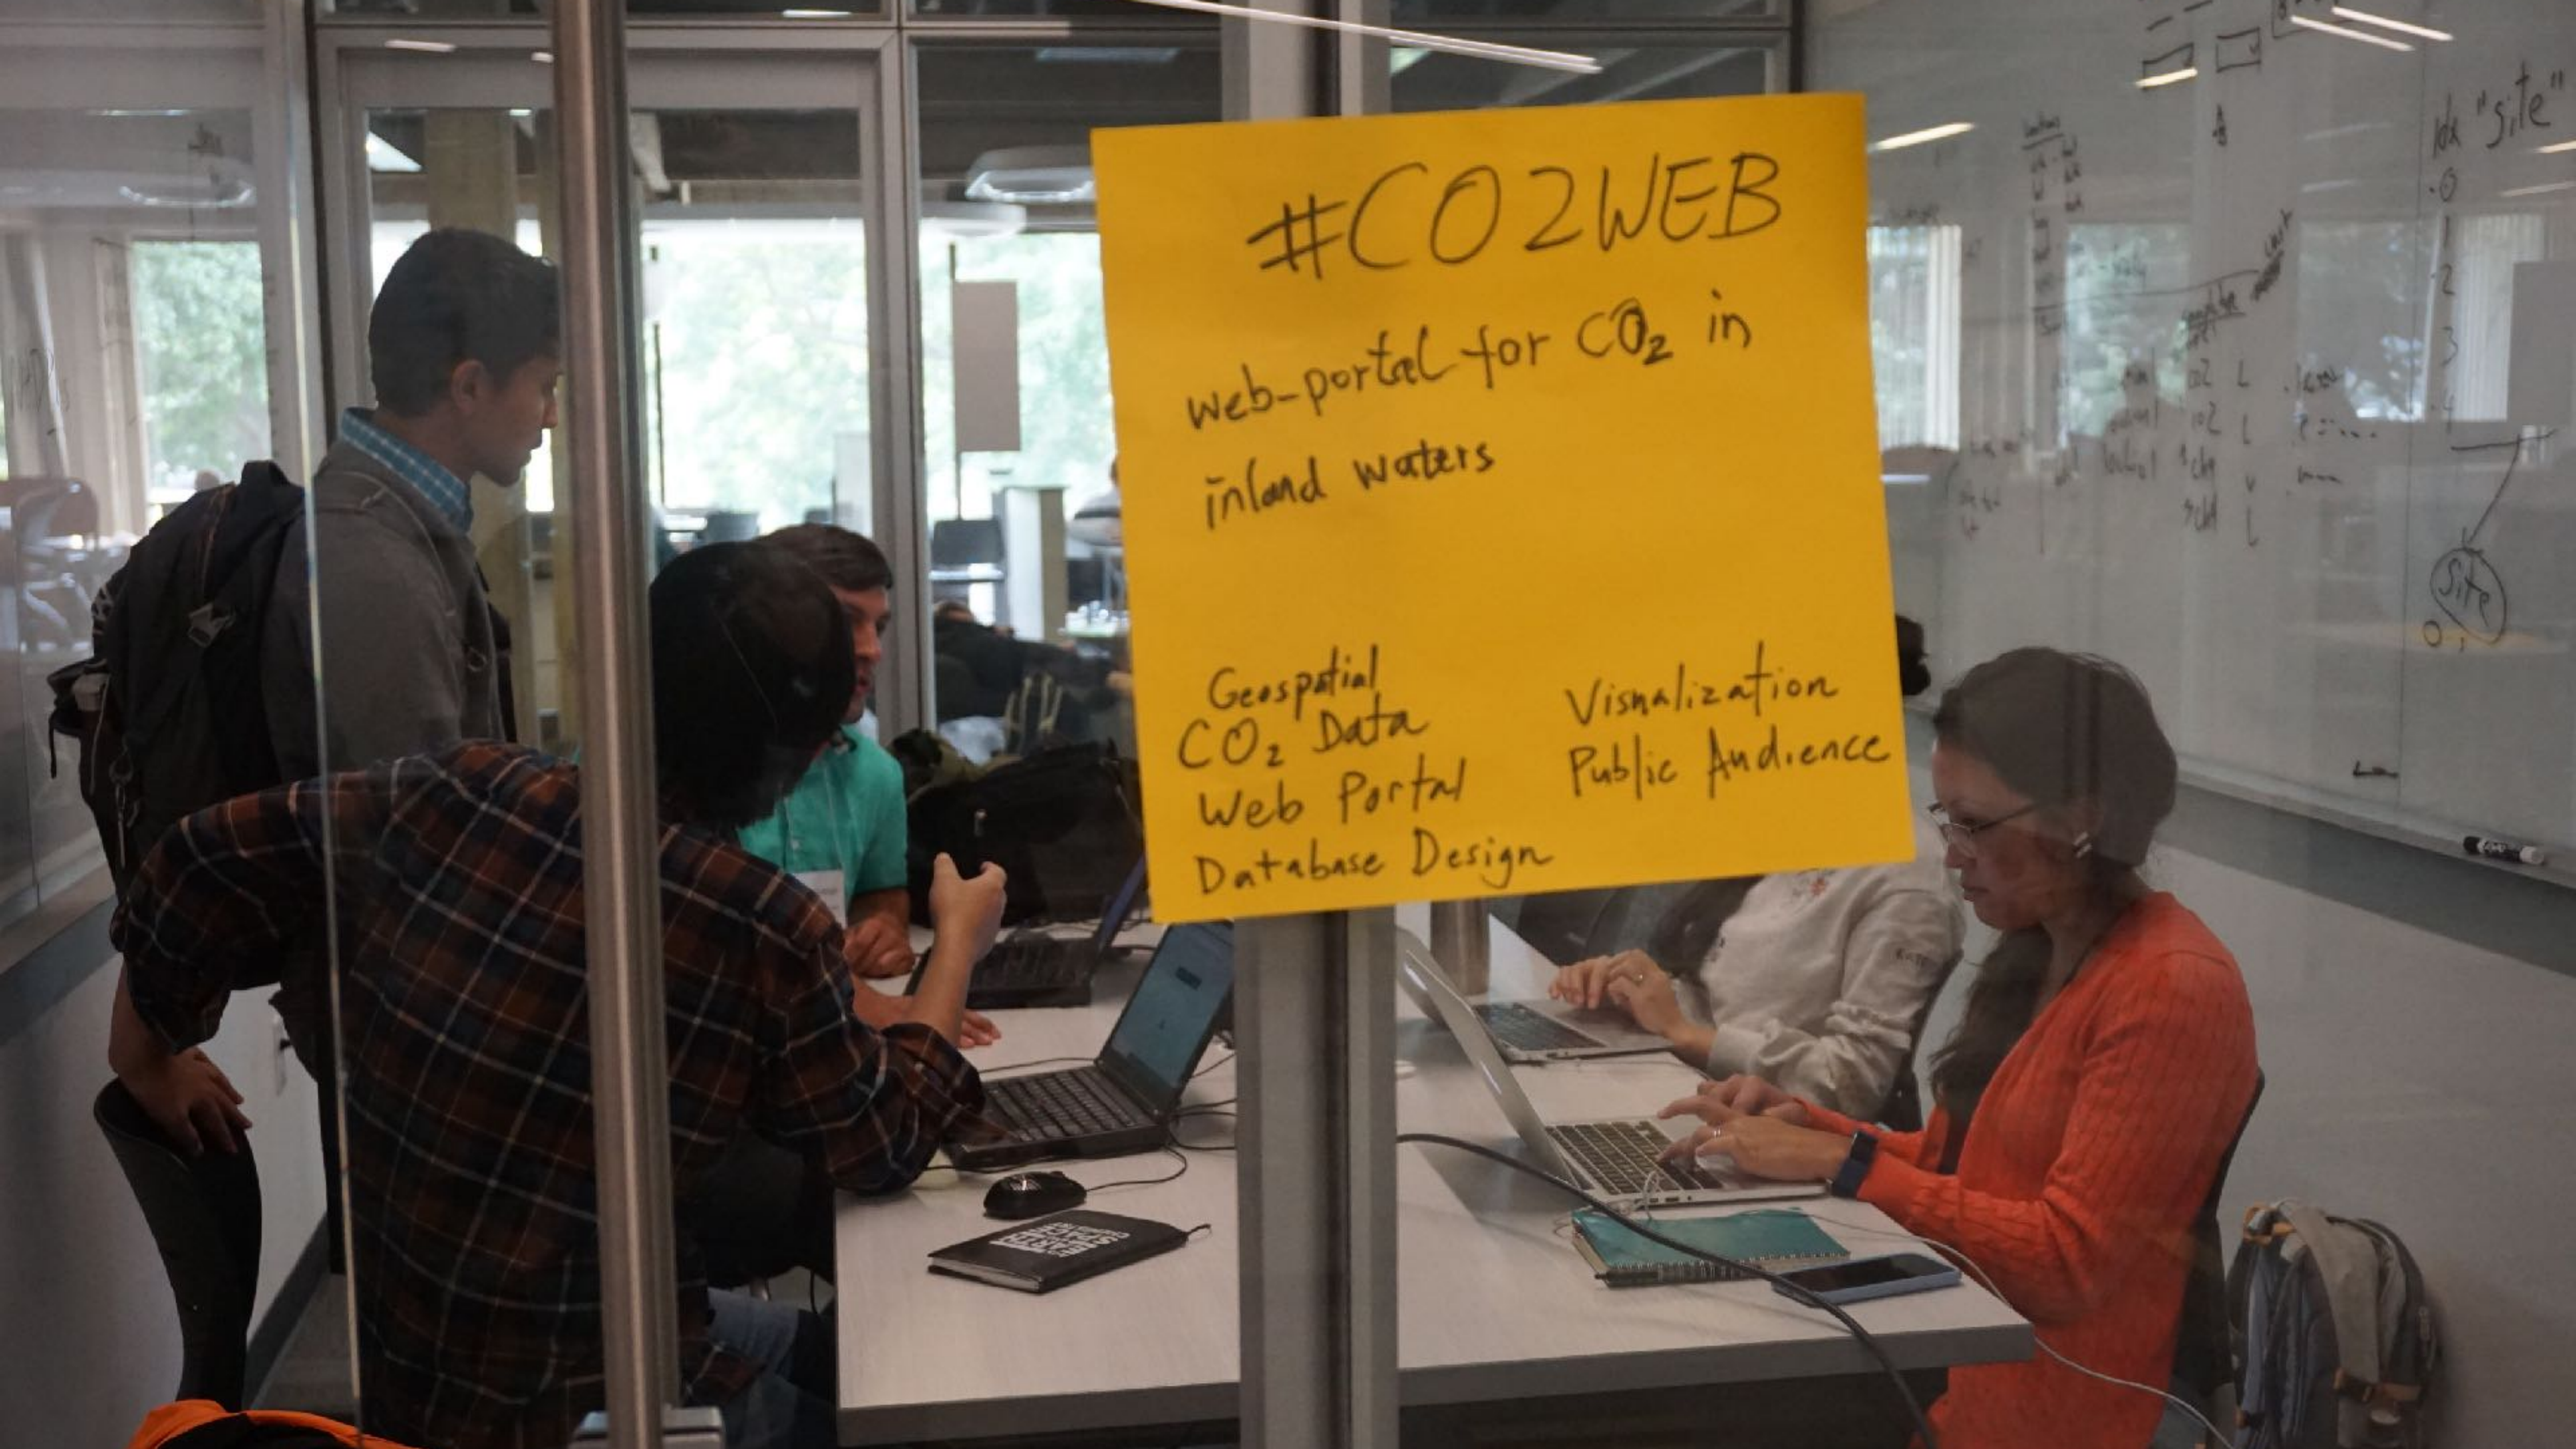
Collaboration

hack (n):

A hack is a small project with a very clear goal, which should be completed by the end of the time initially allocated to it



#CO2WEB
Web-portal for CO_2 in inland waters
Geospatial
CO_2 Data
Web Portal
Database Design
Visualization
Public Audience

Does it work?

- track long-term outcomes (papers, software, …)
- evaluation via post-attendance surveys
- ethnographic work
- case studies
- team photos
- regular discussions across hack weeks

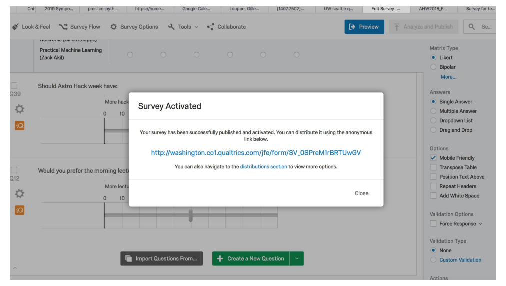
Astro Hack Week 2018

Wrap Up Slides
August 6-10, 2018

AHW 2018 Survey

(Daniela Huppenkothen + Antonia Rowlinson)

... is ready for you! (Link + password tomorrow morning!)



Tutorials for formulating problems in a Bayesian way

Leon Trapman, Mohammadjavad Vakili, Iain Murray, Andrei Igoshev, Daniel Mortlock

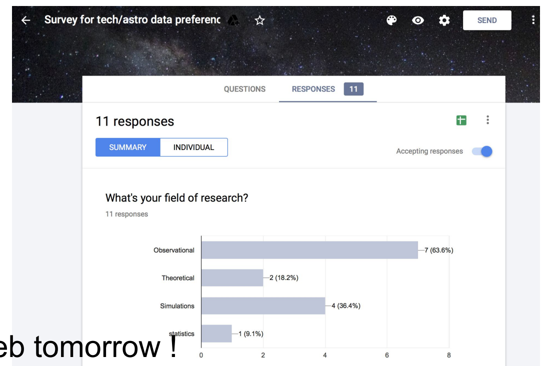
(community hack; 2018-08-09; IBM & Astro Hack Week)

1. Inferring distance to a star from a parallax measurement [A.I.; DONE]
2. Inferring cosmological parameters from power spectrum (with emulation) [M.V.]
3. Inferring luminosity of a star from parallax and flux measurements [A.I.; EXTENSION OF 1.]
4. Inferring the Solar System potential from a snapshot of planets kinematics [I.M.; PUBLISHED]
5. Inferring the mass of the Galactic halo from Magellanic clouds [I.M.; PUBLISHED]
6. Inferring the age of neutron stars from Galactic position, parallax and proper motion [A.I.]
7. Inferring dust content of a protoplanetary disk from an ALMA image [L.T.; SORT-OF-DONE]
8. Inferring whether an asteroid will hit the Earth [I.M., D.M.]
9. Inferring the properties of a merger from gravitational wave observations [A.I.]
10. Inferring which card is showing of white-white, white-black, black-black [I.M., D.M.]
11. Inferring the number density of galaxies from a survey [D.M.]

Survey for tech/astro data preference

Amruta Jaodand
Daisy Mak
Lilianne Nakazono
NorhaslizaYusof

And YOU !



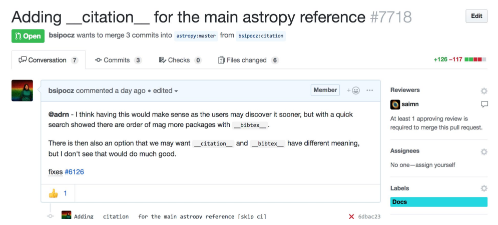
We will launch our web tomorrow !

Brigitta Sipőcz

Sentiment analysis of GitHub issue/PR comments

Fail: run into API limits after the first 437th comment, given up.

Made sure __citation__ and __bibtex__ works. It does now.

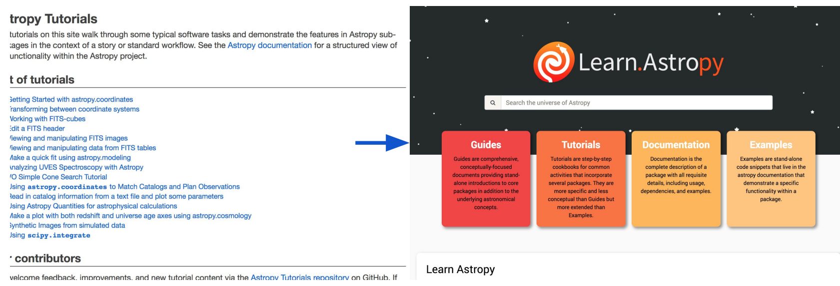


TODO: make sure **makecite** uses __citation__/__bibtex__ when available

Adrian Price-Whelan

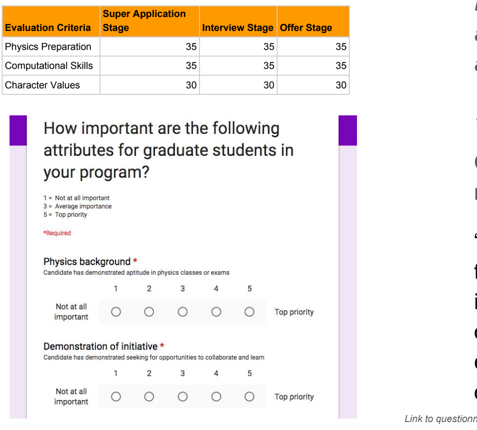
Succeeded in getting Brigitta to attempt sentiment analysis on GitHub issue and pull request comments (but see previous slide)

Worked on infrastructure and in progress overhaul of Astropy tutorials site



Astro Grad Admissions Optimization: questionnaire and output

Camila, Malavika, Pearce, Riccardo, Robin, Sean, Stalia, Tarun



Based on your priorities, the following assessment tools are recommended for admissions to your program:

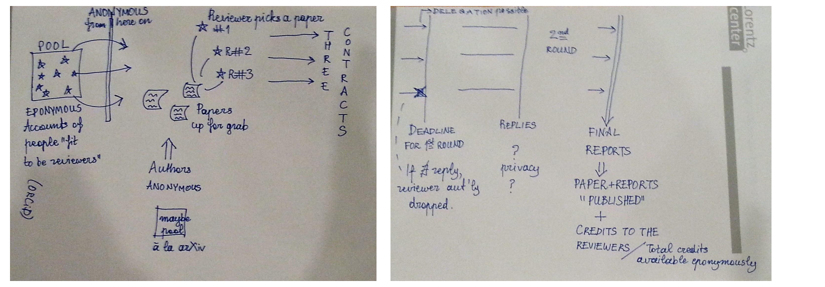
...

Questions to include in letters of reference:

"Briefly (in 5-6 sentences) describe a time that the candidate demonstrated initiative. This could include reaching out to potential mentors or collaborators, learning independently, or taking on tasks on their own."

Eleni & Alexandar, Daniel, Yusra — Peer review and the blockchain

A possible implementation of the peer-review system (as it is today) without journals, with blockchain. [More will be written in the doc...]



https://docs.google.com/document/d/1fwMtRsYj2A-NHY3pgZJ38DHZvwhtkeIlXZq2UiMOoYQ

Sentiment analysis via Google NLP API - Jeroen

Steps:
- Use Github API to pull in some comments
- Created a Google Cloud Project, enabled NLP API
- Created credentials
- Use Google NLP API to parse the text

Some results of PR: https://github.com/astropy/astropy/pull/7712

I believe the grouping should work for `Time` mixins, too now that sorting is working?
Score: 0.6 Magnitude: 1.2

so if this should fail, could you add another example where shorting is failing for these columns?
Score: -0.7 Magnitude: 0.7

note that at this point `keys` had to be an `ndarray`, so all the code below dealing with a pre-made index was never being run.
Score: -0.1 Magnitude: 0.3

Score: -1 negative, 1.0 positive. Magnitude: How strong a reaction is

AHW 2019 and 2020 Venues — Lauren and Ellie

Finding venues for unique conferences is challenging, conference venues are expensive

Keep AHW affordable, look for venues that include some budget participants, small/non-existent conference costs

Venues are already booked for 2019 and looking applications for 2020

Flatiron Institute, Banff International Research Station for Mathematical Innovation and Discovery, Casa Matematica Oaxaca, Ringberg

Other ideas/suggestions ?? Add them to this document please !!

ScienceTheatre hack week

Ruth, Daniella, Pearse, Marie

- Discussed motivation, goals and objectives
- Structure
- Venue
- Funding
- Program
- Expectations and outcomes

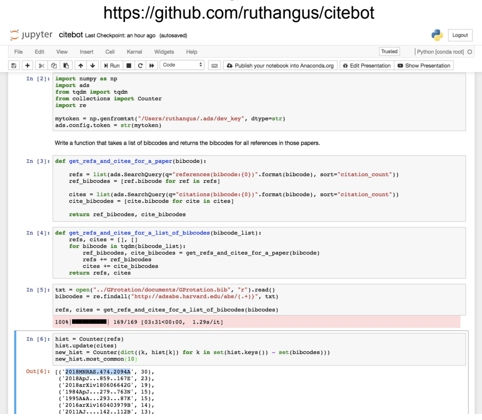
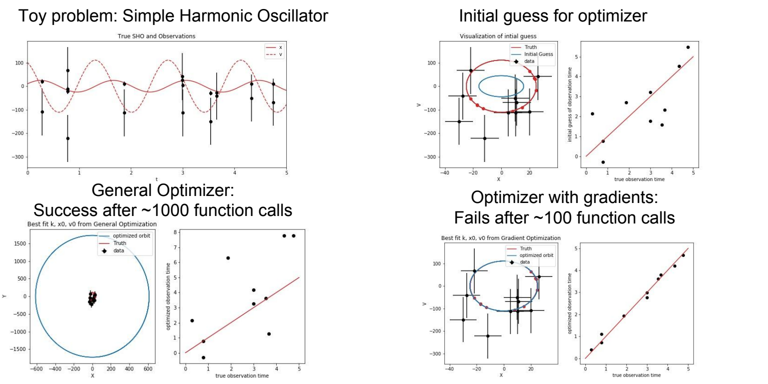
citebot

RA & DFM
https://github.com/ruthangus/citebot



Lauren Anderson, Adrian Price-Whelan, Dan Foreman-Mackey, Iain Murray

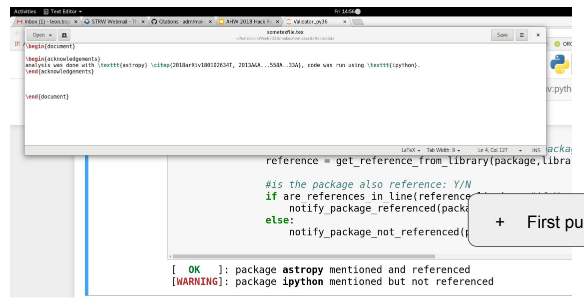
Gradients of likelihood model to use HMC samplers, or various optimization stuff



makecite —> check_cite

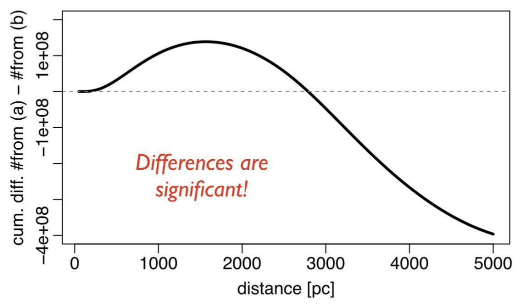
Leon Trapman

+ Adrian Price-Whelan/ Alexander Mechev / Julia Melo Rodrigues de Aguiar / Brigitta Sipőcz



Coryn Bailer-Jones, MPIA Heidelberg — *"Inverse parallax isn't distance"*

I compared no. of stars in Gaia-DR2 within some distance as computed by
(a) inverse parallax
(b) mode of posterior (from our distance catalogue: 2018AJ....156...58B)



Riccardo Buscicchio, University of Birmingham, UK

Challenge: Try not be scared by numerical integration, i.e. evaluate

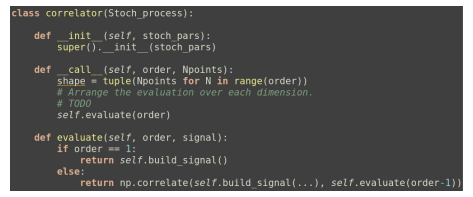
$$H_n(\tau_1,\ldots,\tau_n)=\int dt_1\ldots dt_n s(t_1-\tau_1)s(t_2-\tau_2)\ldots s(t_n-\tau_n)$$

What did we achieve:

recursive, almost-brute-force approach (thanks, Brigitta!)

$$H_n(\tau_1,\ldots,\tau_n)=\int dt_n H_{n-1}(\tau_1,\ldots,\tau_{n-1})s(t_n-\tau_n)$$
$$=\mathrm{Corr}\left(H_{n-1},s(t_n-\tau_n)\right)$$
$$H_1(\tau)=s(t_1-\tau)$$

(soon-to-be) Concrete outcome:



Thoughts: Any clever implementation is welcome. Btw, non-gaussianities are fun!

ASTRO HACK WEEK LOCAL/REGIONAL EDITION

Lilianne, Stephanie, David

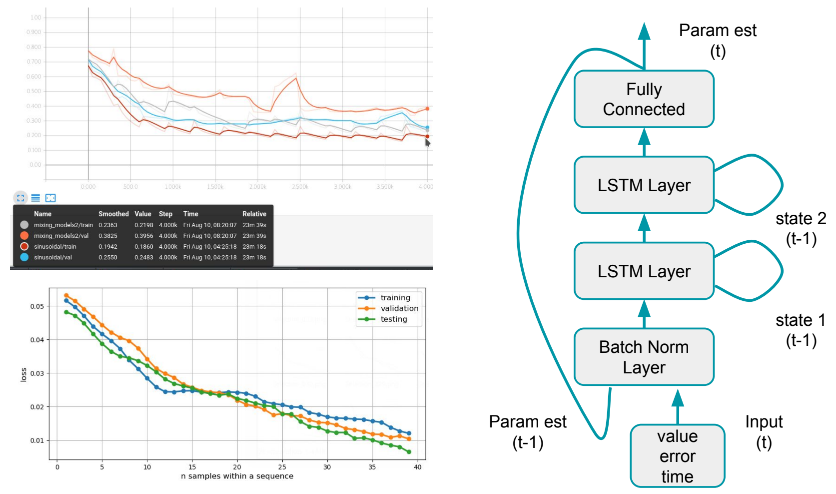
Goals:
- To further extend reach to people who want to learn about astrohack (tools, etc) and its topics but couldn't afford to come to international venues, have fewer resources or were not accepted to the workshop.
- To lessen language barriers. For example, not everyone could speak English so if in a regional/local setting, if everyone speaks Portuguese then easier to teach or implement the workshop.
- To encourage people to learn new topics beyond their choice of study and engage them to use these topics for their perusal, expand skills and learning.
- To accomplish good activities for the astronomy society in the local country and in the general public as a whole. MORE IDEAS? SUGGESTIONS?

Link:
https://docs.google.com/document/d/1xRiE6CGYTSHQ6K2iEnprLmj3u9fMVUUncIxX-pxdAPU/edit?usp=sharing

Motivator - Chrome Extension

Boris L
Nicolas A

Including great historical quotes from Ru Paul, Beyonce, your grandma, etc.



Deep Time Series

Alexander, Brigitta, Ellianna, Gilles, Nicolas, Pearse, Rodrigo, Rohan, Ruth, Tarun

Goal

There is a lot of information about the mass, age and rotation period of a star in its light curve but our physical models and the tools we use to extract this information are flawed. We postulate that we can do better with RNNs.

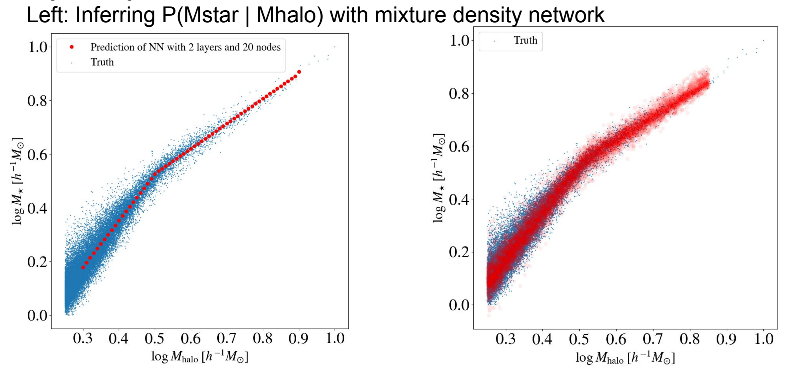
Learnings
- Data pre-processing is hard.
- RNNs are cool.
- RNNs are expensive - try other approaches first!

Next Steps
1. Run this architecture on 16K Kepler Red Giants star data
2. Apply a Generative Adversarial Network?
3. First few key features to investigate from Kepler data: Mass, age, rotation period

Link to learnings document: https://tinyurl.com/yauuw98z

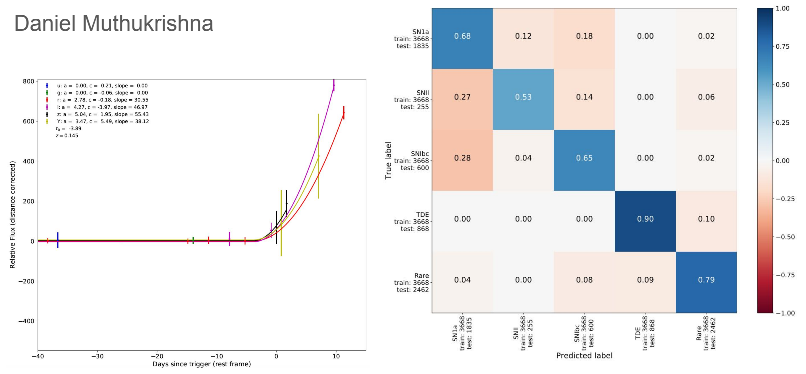
Mohammadjavad Vakili with lots of helpful practical advice from Cole Clifford

Inferring the central galaxy stellar mass-halo mass relation with Neural nets:
Right: Regression with simple tensorflow implementation of FC NN
Left: Inferring P(Mstar | Mhalo) with mixture density network



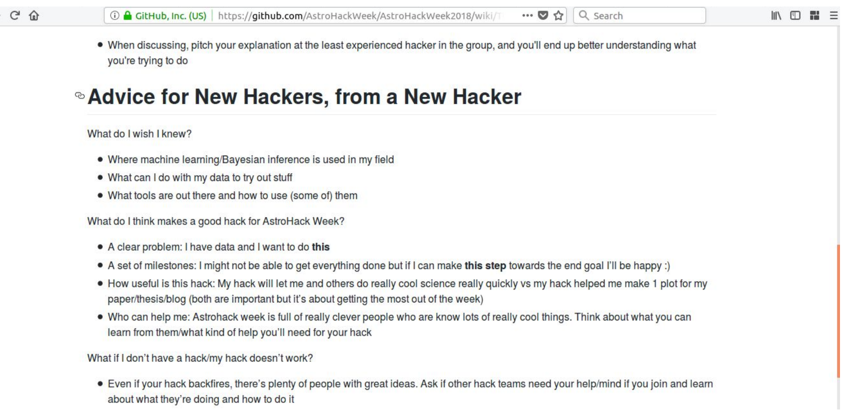
Recurrent Neural Net (GRU) and 1D CNN for early transient light curve classification

Daniel Muthukrishna



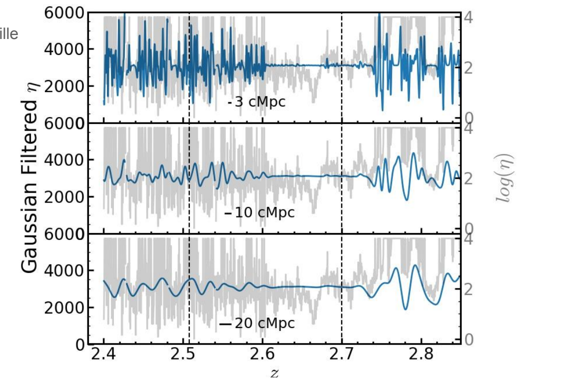
How to make the most out of AstroHack Week

Pearse Murphy



Using Gaussian Bandpass to Filter Data

Sean Morrison
Laboratoire d'Astrophysique de Marseille



Pearse Murphy, Trinity College Dublin, Ireland

Challenge: Compute 512 FFTs on ~2 million points without killing my computer

What did we achieve: Found a python wrapper for the FFTW library and implemented it. Unfortunately there was no significant speed up.

Concrete outcome: A "lazy" solution is to do 512/N FFTs on N computers at the same time and collect data at the end

Thoughts: I might join a different hack - feature recognition with machine learning type of thing.

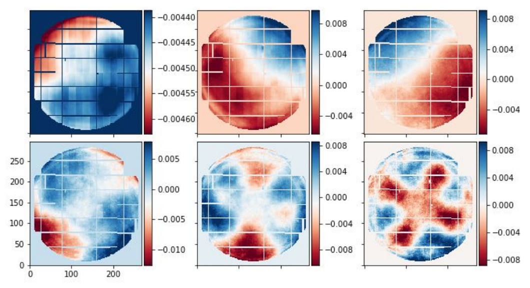
Yusra AlSayyad (Princeton University/LSST)

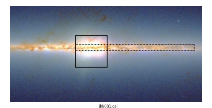
Yusra AlSayyad (Princeton University/LSST)

Goal: Explore HSC backgrounds

Produced some interesting eigen-backgrounds for the Y-band.

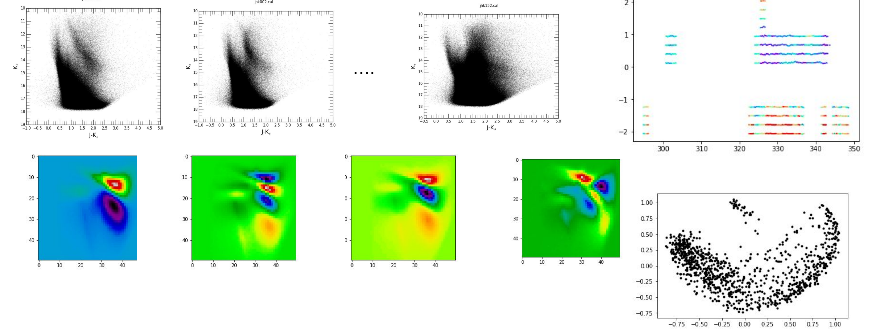
Thanks to Rodrigo, Matthew, Nicolas for brainstorming with me





Efsan Sökmen - Iain Murray
Thanks to : Eleni Petrakou and Andrei Igoshev

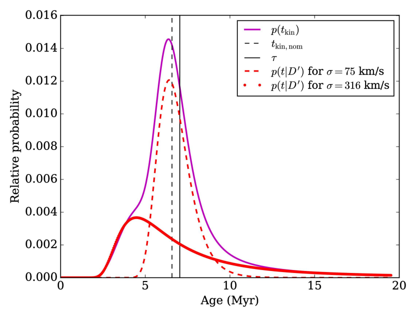
PCA on Stellar Populations in the Southern Plane - VVV survey



Andrei Igoshev, Technion, Israel

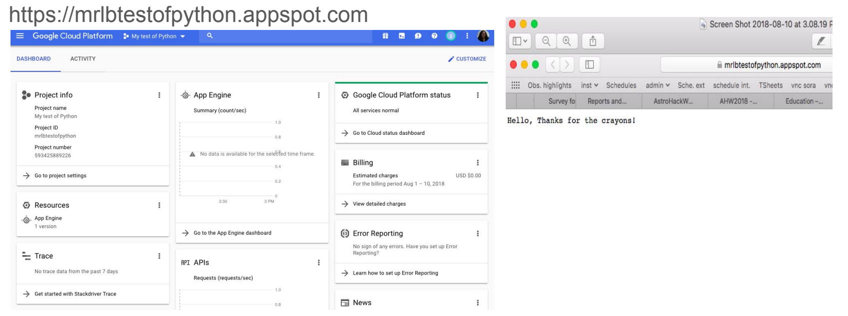
Deriving the posterior for a variable which depends on many measured values but not measured itself.

Posterior is derived.



FUN with GOOGLE CLOUD PLATFORM Python APP Engine

https://mrlbtestofpython.appspot.com

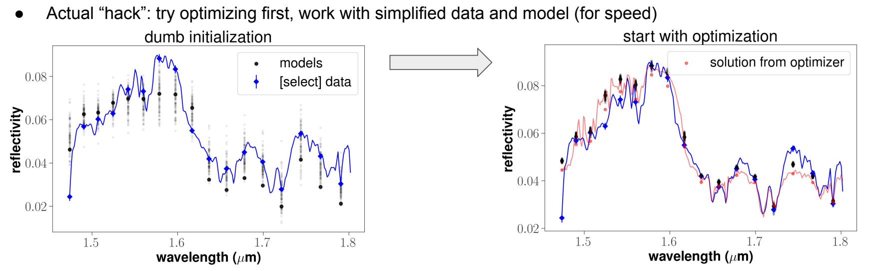


Improved parameter estimation: planet spectra and RT models

Statia Cook, Columbia Univ./AMNH

Help from: Iain Murray (!!), Lauren Anderson, Becky Steele, Brigitta Sipőcz, Daniela

- runs with *emcee* are slow, don't always converge well, not sure if method good for my 10-15 model parameters
- Initial idea: test out something other than emcee
- Actual "hack": try optimizing first, work with simplified data and model (for speed)



Results: works better! I learned that using optimizer first is a good idea :-)

Cardboard Universe: tinyurl.com/3dexoplanets

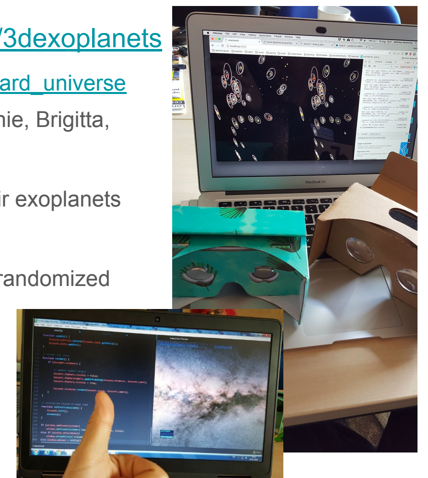
https://github.com/beckysteele/cardboard_universe

Team: Matt, Ellie, David, Efsan, Stephanie, Brigitta, Yanett, Becky

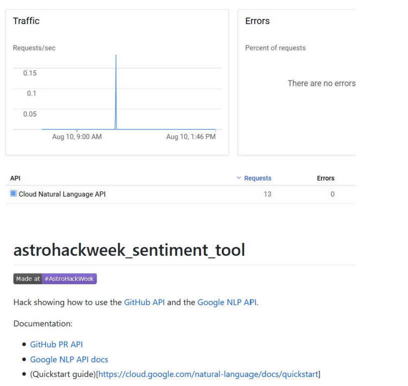
Challenge: Zoom through stars and their exoplanets using Google Cardboard + Three.js

Achieved: In-browser prototype ready (randomized systems only)

Next steps: Connect Exoplanet Archive data to 3D simulation, input a 360 deg view with a Milky Way background, and make it Google Cardboard-able



Jeroen Bédorf - Leiden University/Observatory

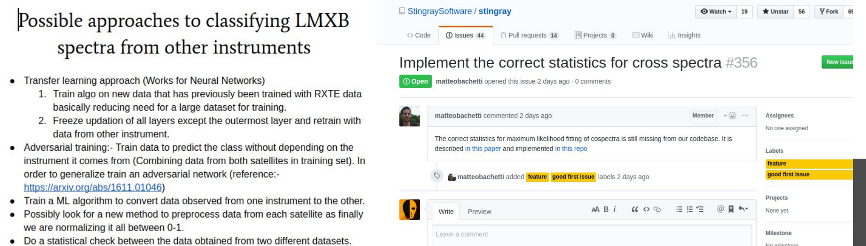


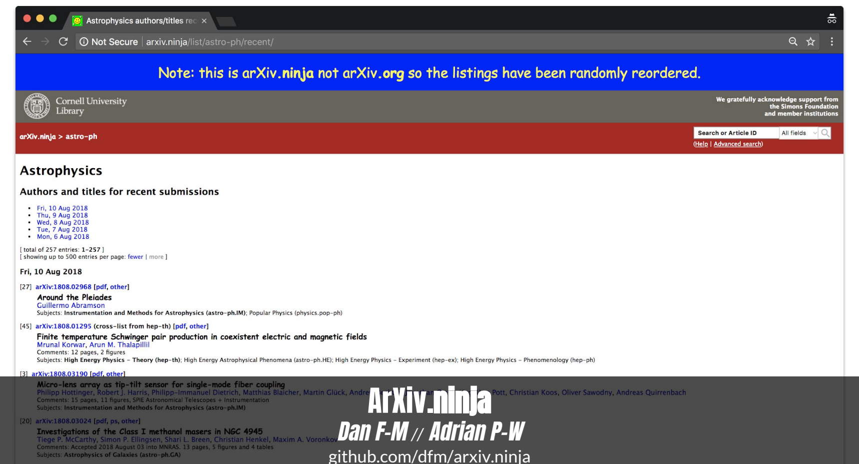
Google APIs, challenges involved: Finding creditcard details, access permissions, service user roles, including credentials in the API request, accessing the results, enabling the correct APIs, installing the correct Python packages.

https://github.com/jbedorf/astrohackweek_sentiment_tool

Rohan Pattnaik

Personal Hack Objectives:
- Compile a list of approaches to classify spectra from other instruments
- Get started with open source development





BIG DATA METHODS FOR EXTRACTING RELATIONS BETWEEN THE TIMING OF SOLAR FLARES AND PLANETARY POSITIONS

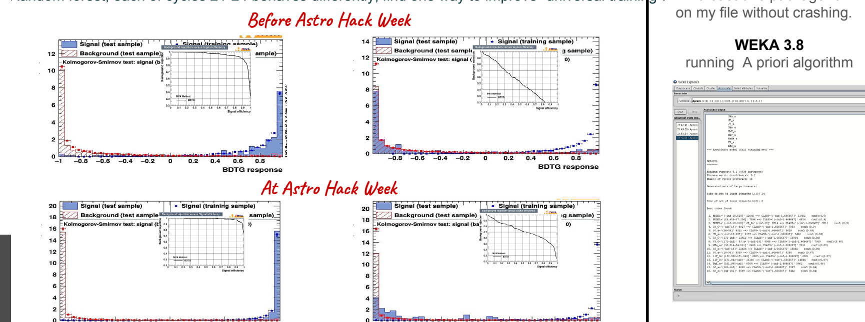
Eleni Petrakou

△ Indications exist for a relation between them.
△ Goals of the week: Take a solid step in classification + Kickstart associative rules mining.

ONE SOLID STEP IN CLASSIFICATION:
Random forest; each of cycles 21-24 behaves differently; find one way to improve "universal training".

KICKSTART RULES:
At least one package running on my file without crashing.

WEKA 3.8
running A priori algorithm



AstroCapital

Goal: Create a web-page which educates and allows astronomers to communicate about tech-enabled all-things-astro.

Why:
- Lack of such a platform
- Efficient, new ways to go from data to astronomy/science
- Open platform for everyone
- share, contribute and stay updated!
- Central astro-tech resource hub
- Connecting ex-/non-astronomers to the astro community

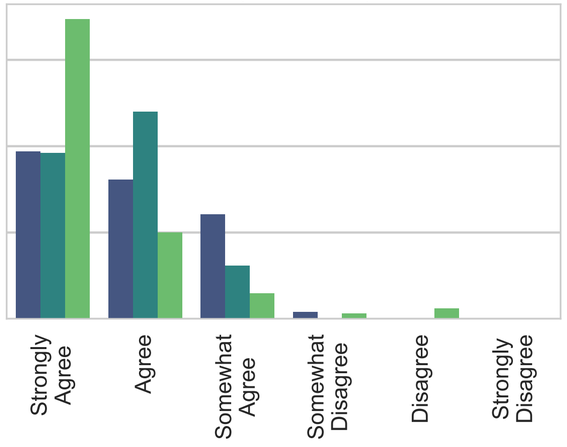
AmrutaJaodand
Daisy Mak
LilianneNakazono
Zach Akil
NorhaslizaYusof
Becky Steel
Mohammadjavad Vakili

Status: Survey and Web

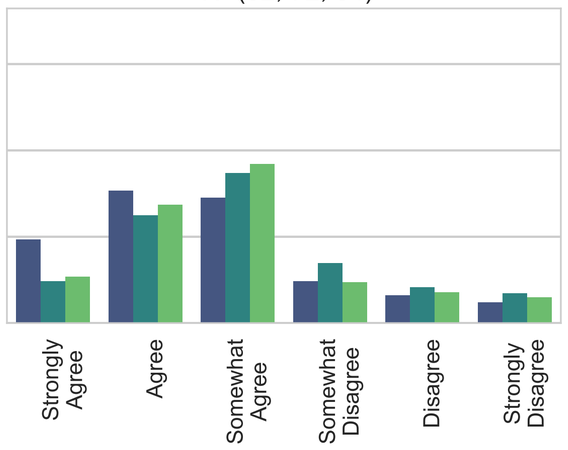
What next:
- Let us know if you can contribute to any sections (e.g. writing blogs)
- Join us in maintaining the page!

Survey Results

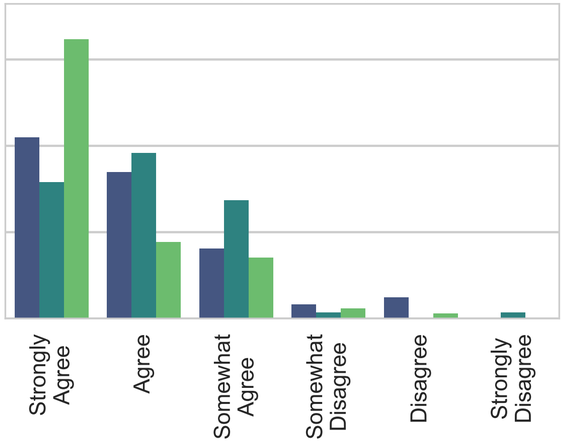
(b) I feel like I learned things which improve my day-to-day research; N=(62, 73, 85)



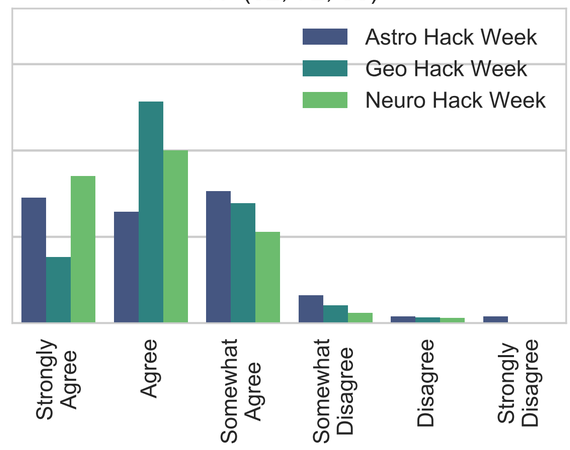
(d) I ended up teaching things to other people; N=(62, 72, 84)



(e) I felt like I built valuable connections at X Hack Week; N=(62, 73, 85)



(h) I feel like X Hack Week has made me more comfortable with doing open science; N=(62, 72, 85)



Take-Away Lessons

build a community first
